

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1-30. (Canceled).

31. (New) A method of processing information, which comprises a step of adding information which is not contained in inputted text, to voice, when the inputted text is converted to the voice.

32. (New) A method of processing information, which comprises a step of adding information which is not contained in inputted text, to the inputted text, when the inputted text is converted to the voice.

33. (New) The method according to claim 31 or 32, wherein the adding step is carried out in interpretation.

34. (New) The method according to claim 31 or 32, further comprising a step of getting analysis result by analyzing the text and determining the adding information on the basis of the analysis result.

35. (New) The method according to claim 31 or 32, further comprising a step of getting analysis result by analyzing the text and determining amount of the information on the basis of the analysis result.

36. (New) The method according to any one of claims 31 or 32, further comprising a step of getting analysis result by analyzing the text and determining time length for reproducing the information on the basis of the analysis result.

37. (New) The method according to claim 31 or 32, further comprising a step of analyzing reaction time of a target for which the voice is reproduced and determining the adding information on the basis of the analysis result.

38. (New) The information processing system according to claim 31 or 32, wherein the adding information has the effect that the action of a target for which the voice is reproduced is promoted, when the converted voice is reproduced.

39. (New) An information processing system comprising:  
means for converting inputted text to voice; and  
information changing means for receiving the voice and adding information which is not contained in the inputted text, to the voice,  
wherein the voice with the added information is reproduced.

40. (New) An information processing system comprising:  
information changing means for receiving inputted text and adding information which is not contained in the inputted text; and  
means for converting the output of the information changing means to voice,  
wherein the voice with the added information is reproduced.

41. (New) The information processing system according to claim 39 or 40, wherein the means for converting inputted text to voice is interpretation means.

42. (New) The information processing system according to claim 39 or 40, further comprising:  
analysis means for getting analysis result by analyzing the text; and  
additional-information determining means for determining the adding information on the basis of the analysis result.

43. (New) The information processing system according to claim 39 or 40, further comprising:  
analysis means for getting analysis result by analyzing the text; and  
additional-information-amount determining means for determining amount of the adding information on the basis of the analysis result.

44. (New) The information processing system according to claim 39 or 40, further comprising:

analysis means for getting analysis result by analyzing the text; and  
reproduce-time determining means for determining time length for reproducing the  
adding information on the basis of the analysis result.

45. (New) The information processing system according to claim 39 or 40, further  
comprising:

reaction-time analyzing means for analyzing reaction time of a target for which the  
voice is reproduced; and

additional-information determining means for determining the information on the  
basis of the analysis result.

46. (New) The information processing system according to claim 39 or 40, further  
comprising reproducing means for reproducing the voice converted,

wherein the action of a target for which the voice is reproduced is promoted, by the  
adding information.

47. (New) A program for causing a computer to perform:  
a process of converting inputted text to voice; and  
a process of adding information which is not contained in the inputted text, to the  
voice.

48. (New) A program for causing a computer to perform:  
a process of converting inputted text to voice; and  
a process of adding information which is not contained in the inputted text, to the  
inputted text.

49. (New) A terminal comprising:  
means for converting inputted text to voice; and  
means for adding information which is not contained in the inputted text, to the voice.

50. (New) A terminal comprising:  
means for converting inputted text to voice; and

means for adding information which is not contained in the inputted text, to the inputted text.

51. (New) A server comprising:

means for converting inputted text to voice; and

means for adding information which is not contained in the inputted text, to the voice.

52. (New) A server comprising:

means for converting inputted text to voice; and

means for adding information which is not contained in the inputted text, to the inputted text.

53. (New) A robot comprising:

analysis means for analyzing a message and determining the most effective direction for transmitting the message;

motion control means for turning to the direction; and

information reproducing means for reproducing the message.

54. (New) The robot according to claim 53, further comprising message generating means for generating the message.

55. (New) The robot according to claim 53 or 54, wherein the message is an interpretation result and the robot further comprises interpreting means for generating the interpretation result.

56. (New) A robot comprising:

analysis means for analyzing a received message and determining the most effective direction for receiving a prospective message;

motion control means for turning to the direction; and

a sensor for receiving the message.

57. (New) The robot according to claim 53 or 54, further comprising:

a memory for storing a plurality of directions, and

selecting means for selecting the most effective direction from direction data stored in the memory.

58. (New) The robot according to claim 53 or 54, further comprising:  
direction identifying means for identifying the direction for a target which the message is transmitted; and  
motion control means for turning to the direction identified.

59. (New) The robot according to claim 56, further comprising:  
direction identifying means for analyzing a received message and identifying the direction for a target which receives the message;  
motion control means for turning to the direction identified.
